Resistance to intercrystalline corrosion of welded joints made of unstabilized 18/8 steel. K. J. Hender (Slovakia), Klužno, Czech. *Průmysl* 24, 306-33 (1957). — During elec. welding the joints were sprinkled with water thus reducing the intercryst. corrosion of unstabilized 18/8 steels. Care was exercised that by water or steam reached the elec. arc. In steels contg. 0.15-0.1% C the resistance to intercryst. corrosion was greatly increased, but not fully avoided. The welds contg. the same amt. of C were fully free from such corrosion, whether cooled with water or not cooled. At all. In steels contg. 0.11% C, elec. welding with simultaneous water cooling the degree of intercryst. corrosion was narrow but otherwise not avoided.

TITLE: Modern methods of calculating the rigidity and strength of machine parts

SOURCE: Strojirenstvi, v. 16, no. 1, 1966, 3-6

TOPIC TAGS: material fracture, plasticity, steel structure

ABSTRACT: The load capacity of a steel structure is analyzed from three different points of view, using three different methods of computation. The following limiting states are considered: in the first case, the static load and favorable plastic properties of the material; in the second, the static load under conditions which may lead to brittle fracture; and in the third, load varying with time which may result in fatigue failure. A beam with fixed ends and made of 11 523 steel is taken as an example. The calculations give nine results for the load capacity of the beam. In the computations modern theories are demonstrated that should be applied when ascertaining the rigidity and strength of machine parts and steel structures. Orig. art. has: 6 figures and 1 table. TITLE: Dynamic of a ship aggregate with nonlinear elastic coupling

SOURCE: Celostatna konferencie o problemoch dynamiky strojov. 2d, Smolenice, 1961. Dynamika strojov (Dynamics of machines); sbornik prac z konferencie SAV. Bratislava, Vyd-vo SAV, 1963, 420-432

TOPIC TAGS: elastic coupling, ship aggregate, torsional vibration

ABSTRACT: In ship power plants, consisting of a diesel motor, a gearbox, a line shaft, and a propeller, it is usually necessary to examine three types of torsional vibration. While the first two types of oscillation are determined mainly by the flywheel-gearbox-propeller system, the third type is determined by the system of the engine itself. It is useful to separate dynamically the system of the engine from the rest of the aggregate by using an appropriate elastic coupling. When using an elastic coupling with a linear characteristic curve, it is often necessary

Card 1/2

L 47549-66

ACC NR: AT6029439

to prohibit the operation at a certain speed range of the engine. Operational safety can best be served, theoretically, by using an elastic coupling with a progressive characteristic curve which is matched to the characteristic curve of the propeller. Such a coupling is difficult to realize. The demands can be met, however, by using an elastic coupling with a broken characteristic curve, whose initial torsion rigidity is much lower than its ultimate torsion rigidity. The Czechoslovak analogue computer MEDA was used to determine the best torsional vibration and the optimal parameters for the coupling. It was proven that the use of an elastic coupling with broken characteristic curve is of advantage in the case of marine power plants with broad range of normal cruising speeds. TITLE: Combination of varnish coatings with a (sprayed-on) chemically reduced silver layer

PERIODICAL: Strojirenství, 1961, Vol.11, No.8, p.635

TEXT: The classical method of reduction of silver coatings from silver nitrate by means of formaldehyde can also be effected by spraying by means of a two-nozzle spray-gun. Reduction of the silver takes place on the activated surface of the body immediately after impingement of the finely atomized solutions. The formed coating is about 3 μ thick, non-porous and adheres strongly to metal, glass and organic materials. To prevent pumping, a transparent varnish is provided on top of the silver coating. This method is particularly favourable in the timber industry (as a substitute for imported metal foils) and for treatment of small size consumer goods.

CA

The function of trace elements in the nutrition of plants
 II. P. Nemeč, L. Paštyřik, M. Tesálová, A. Lux, and J. Votlíček (Slovak Tech. Univ., Bratislava, Czech). *Chem Zvesti* **5**, 251-7 (1951), cf. *C. I.* **44**, 19819g. The favorable influence on the growth of *Prunus avium*, *Malus sibirica*, and *Pyrus communis* of trace elements, applied in the form MB-49 (C. I. **44**, 19801g) is carried through into the following period of vegetation, even onto the following year, if the optimal dosage is used. In the test plants with the

optimal dosage of I, the increase in growth is doubled even in the second year after application and the thickness and no. of leaves and roots are increased. I decreases the frequency of diseases and improves the physiol. condition. I prolongs the vegetation period of *Prunus insidiosa* and increases the callus formation in *Rosa polyantha*, *Torreya californica*, and *Chamaecyparis obtusa* var. *tetragona*. III. P. Nemeč, J. Votlíček, L. Paštyřik, and R. Nádvarník (Slovak Tech. Univ., Bratislava, Czech). *Ibid.* **272**, 92. Expts with tomato plants (*Solanum lycopersicum*) indicate that such important production factors as fertility and formation of sugar, size of the fruit, health of the plant and the yield are dependent on the presence of trace elements derived from MB-50. MB-50 is modified of B from 10 to 5 parts. The physiol. factors, as affected by trace elements, are dependent on each other. Lab. expts as well as practical tests in agriculture show that the use of a complex of trace elements, and not individual elements, is necessary. Jan Mlýček.

Abstract: By addition of a trace element mixture MEB-49 (B, Mn, Cu, Zn, I, Br, Ti, Sn, Li, Ni, Co, N₂) to the industrial raw material utilized as a nutrient medium in production of bakers' yeasts, a decrease in alcohol formation can be attained.

TITLE: Resistant Staphylococci found on personnel attending domestic animals receiving food with chlorotetracyclin additives

SOURCE: Biologia, no. 4, 1965, 274-279

TOPIC TAGS: man, bacteria, bacteriology, antibiotic

ABSTRACT: 130 attendants working with pigs and cattle were examined to find the presence of strains of Staphylococcus aureus in their noses. Isolated strains positive to coagulase were subjected to tests to determine their sensitivity to 8 antibiotics. 6.5% of the strains resisted penicillin, 2.1% streptomycin, and 19.1% chlorotetracyclin. The resistant strains do affect the attendants. The standard preparations were from the Research Institute of Antibiotics, Rostok. Orig. art. has: 1 figure and 2 tables. [JPRS]

isolated from personnel working in the production of antibiotics 6

SOURCE: Biologia, no. 2, 1966, 109-117

TOPIC TAGS: antibiotic, erythromycin, streptomycin, penicillin, bacteriology

ABSTRACT: 128 groups of staphylococci were isolated from employees of a plant producing antibiotics. Their resistance to 8 antibiotics was studied: benzylpenicillin (PNC), streptomycin (STM), chlorotetracycline (CTC), chloramphenicol (CHL), erythromycin (ERY), bacitracin (BAC), kanamycin (KAN), and vancomycin (VAN). In groups isolated from employees in penicillin production 42% were resistant to PNC, 17 to STM, 15 to CTC, 2 to CHL and 2 to ERY. In CTC production the figures were 28% PNC, 24 to STM, 24 to CTC; where employees worked in fermentation the corresponding % were 45, 71, and 63. Standard preparations were made at the Research Institute of Antibiotics Restok. Orig. art. has: 3 figures and 4 tables. JPRS: 35,814/
